All006 Assignment #7

1. How would you link to the named fragment #jobs on the page employ.html from the home page of the site?

a. **Jobs**

2. Which pseudo-element can be used to generate content that precedes an element?

b. **:before**

3. Which of the following is a mobile web design best practice?

c. **Configure a single-column page layout.**

4. Find the Error. The page below is intended for the navigation area to display on the right side of the browser window. What needs to be changed to make this happen?

**nav { float: left;
Width : 120px; } is the error**

**nav { float: right;
Width: 120px; } is the fix**

Web Research :

It turns out web accessibility and mobile web design often want the same things. For instance, the W3C notes that there is a lot of overlap between these two areas. Web accessibility is about making sure that people with disabilities can use websites. Then there's mobile web design, which is an attempt to make sites work smoothly on phones and tablets. The people using these sites and what they can do may be different but both areas often suffer from similar problems. Luckily, we can often use the same approaches to fix these.

One big place where they connect is in the difficulties people face. A phone user might have problems with a small screen, limited options for typing or clicking, or even things like bright sunlight or a bad internet connection. People with disabilities, on the other hand, have difficulties with their sight, hearing, movement or thinking. Both groups can run into similar problems. For example, it would be difficult to use a touchscreen for a website that requires very precise mouse clicks. Or for someone who has trouble with fine motor skills.

They also agree on how the content should be laid out. Accessibility goal: content that screen readers understand well. This means: use headings, use lists, use clear link text. Content that is well-structured is much easier to read on a mobile's smaller screen. People are able to scan and jump quickly from one part to another. Nobody wants to scroll endlessly down just to complete one topic.

There are also features that benefit both groups. For example, high-contrast text is great for someone with low vision, but it's also very helpful when you're trying to read a website outside on your phone. Larger buttons and touch areas are easier for people with poor fine motor skills, and also easier and more accurate for tapping on small screens. It's important to remove excess data or information you don't really need to make a page work well on mobile, and it's just as important to those with vision problems.
